

Step 1: Locate SmartLink module under spa cabinet in position with best line of sight to router

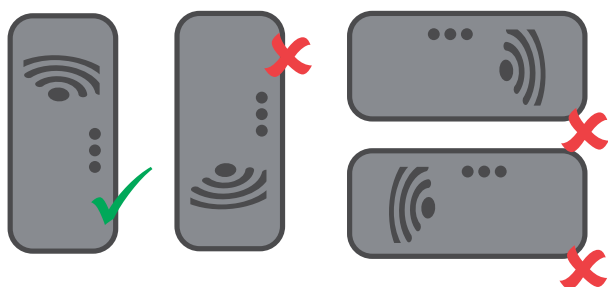

Note: Do not fix module permanently until app setup is complete and best WiFi signal location determined

If spa in pit or under deck, locate module above ground in a **weather protected area** with line of sight to router (longer data cable may be required; max 10m - no joins)

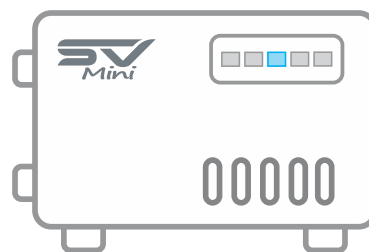

Note: Module **MUST** be orientated vertically to receive adequate signal strength with WiFi logo at the top to maintain water protection

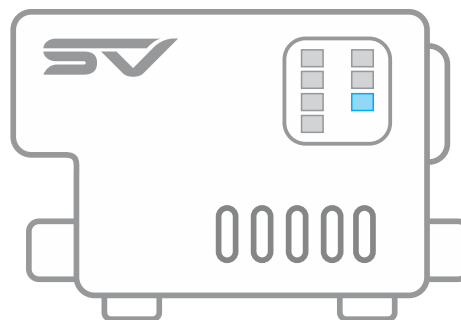

Step 2: Connect data cable from SmartLink module to spa control **EXP1** socket

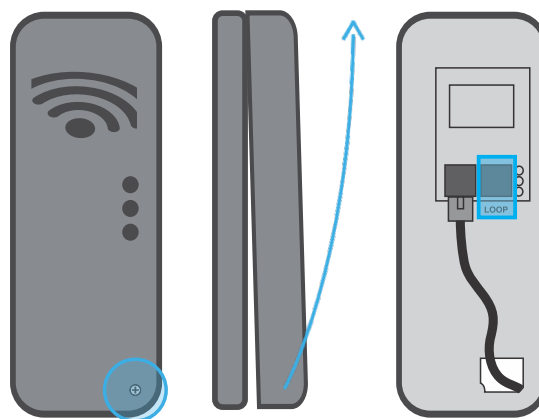

Warning: Hazardous mains voltage is present inside the spa control box whenever power is connected. Installation of the WiFi module should be carried out by a suitably qualified service technician or competent person. **Before removing the spa control box cover or connecting the WiFi module, isolate and switch off all power to the spa at the main supply. Failure to disconnect power before installation may result in electric shock, serious injury, or death.**

NOTE: WiFi only works in EXP1 socket

Note: If EXP1 socket already populated, remove that cable from EXP1 and connect it to the LOOP socket inside module. Ensure data cable coming from SmartLink connects directly to EXP1 socket. If longer data cable in use LOOP port CANNOT be used.

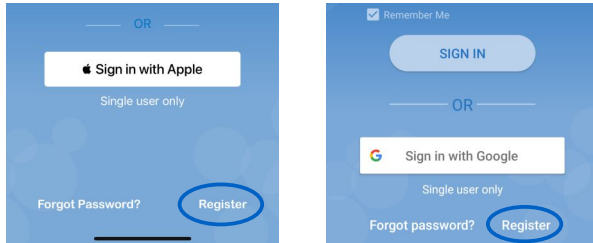

Step 3: Download Spanet SmartLink app

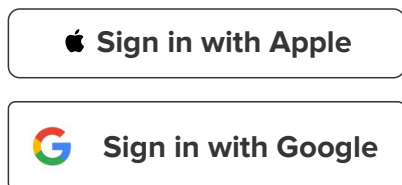

Step 3: Register and/or login to app

Note: If the app is to be used across multiple devices (which use different Apple / Google accounts) then you must create an account using the **Register** option. For additional devices login with the email and password you registered. Do NOT register another account

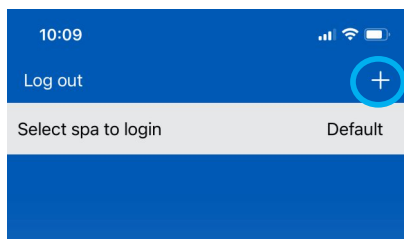

If the app is only to be used on one or more devices sharing the same Apple/Google account, you can use the respective sign in buttons below

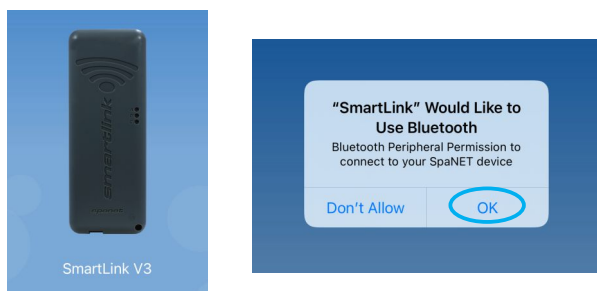

Step 4: Add spa to user account

Note: A spa can only be setup/accessed on one user account, however multiple spas can be added to the same user account

You will require your router WiFi password with you

Step 5: Select SmartLink V3 model

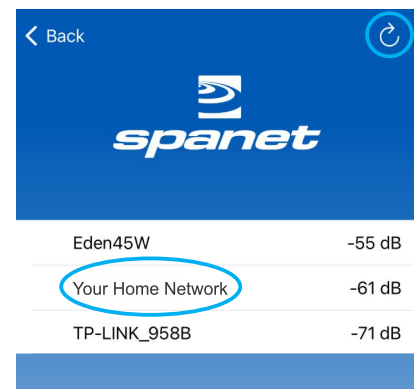

Note: Bluetooth is used for module setup, allow access

Step 6: Select SV module to begin scanning for local WiFi networks

Step 7: Select WiFi network to connect spa to

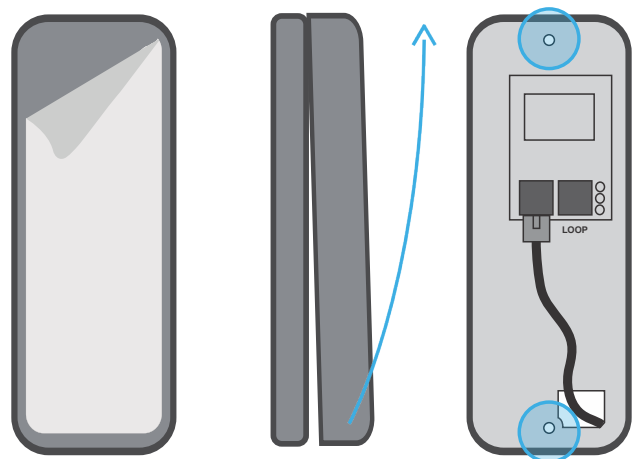

Note: If no WiFi network found, relocate module to a better position and use the refresh button to conduct a new WiFi scan to see if signal has improved. Signal strengths closer to 0 are stronger.

Step 8: Enter password for your WiFi network

Step 9: Enter a spa name and setup is complete

Step 10: Fix module position using adhesive gasket or screw mounts inside module
